Connecting Asia Pacific ports in a changing world

Innovations in Shiploader Technology for Wharf Environmental Management – QAL Case Study

Dr. Adam Mayers – Principal Mechanical Engineer
Aspec Engineering Pty Ltd

resources

ports

infrastructure

asset management

design

Introduction

- QAL (Gladstone QLD) exports 2.8 MTPA of alumina
- Previous Alumina Shiploader and conveying system generated excessive dust during operation but unable to upgrade due to wharf condition and utilization restrictions.
- ASPEC engaged as technical lead in owners engineer to identify and implement solution from pre-feasibility -> execution. A complete solution was required by December 2023.
- Alignment with UN Sustainable Development Goals

A photograph of an industrial pier at dusk. The pier is a long, dark structure supported by several tall, lattice-work towers. A crane is visible on the pier. In the background, a large ship is docked at the pier. The sky is a mix of dark blue and orange, suggesting sunset or sunrise. The water in the foreground is calm, reflecting the light from the sky and the pier. The overall scene is industrial and somewhat somber due to the low light.

Problem 1 Excessive Dust

Root Causes?

Chute opens up when luff up for hatch changes

Hard to Seal Shuttle Airslide

Chute not engaged with pile

Tripper & belt profile

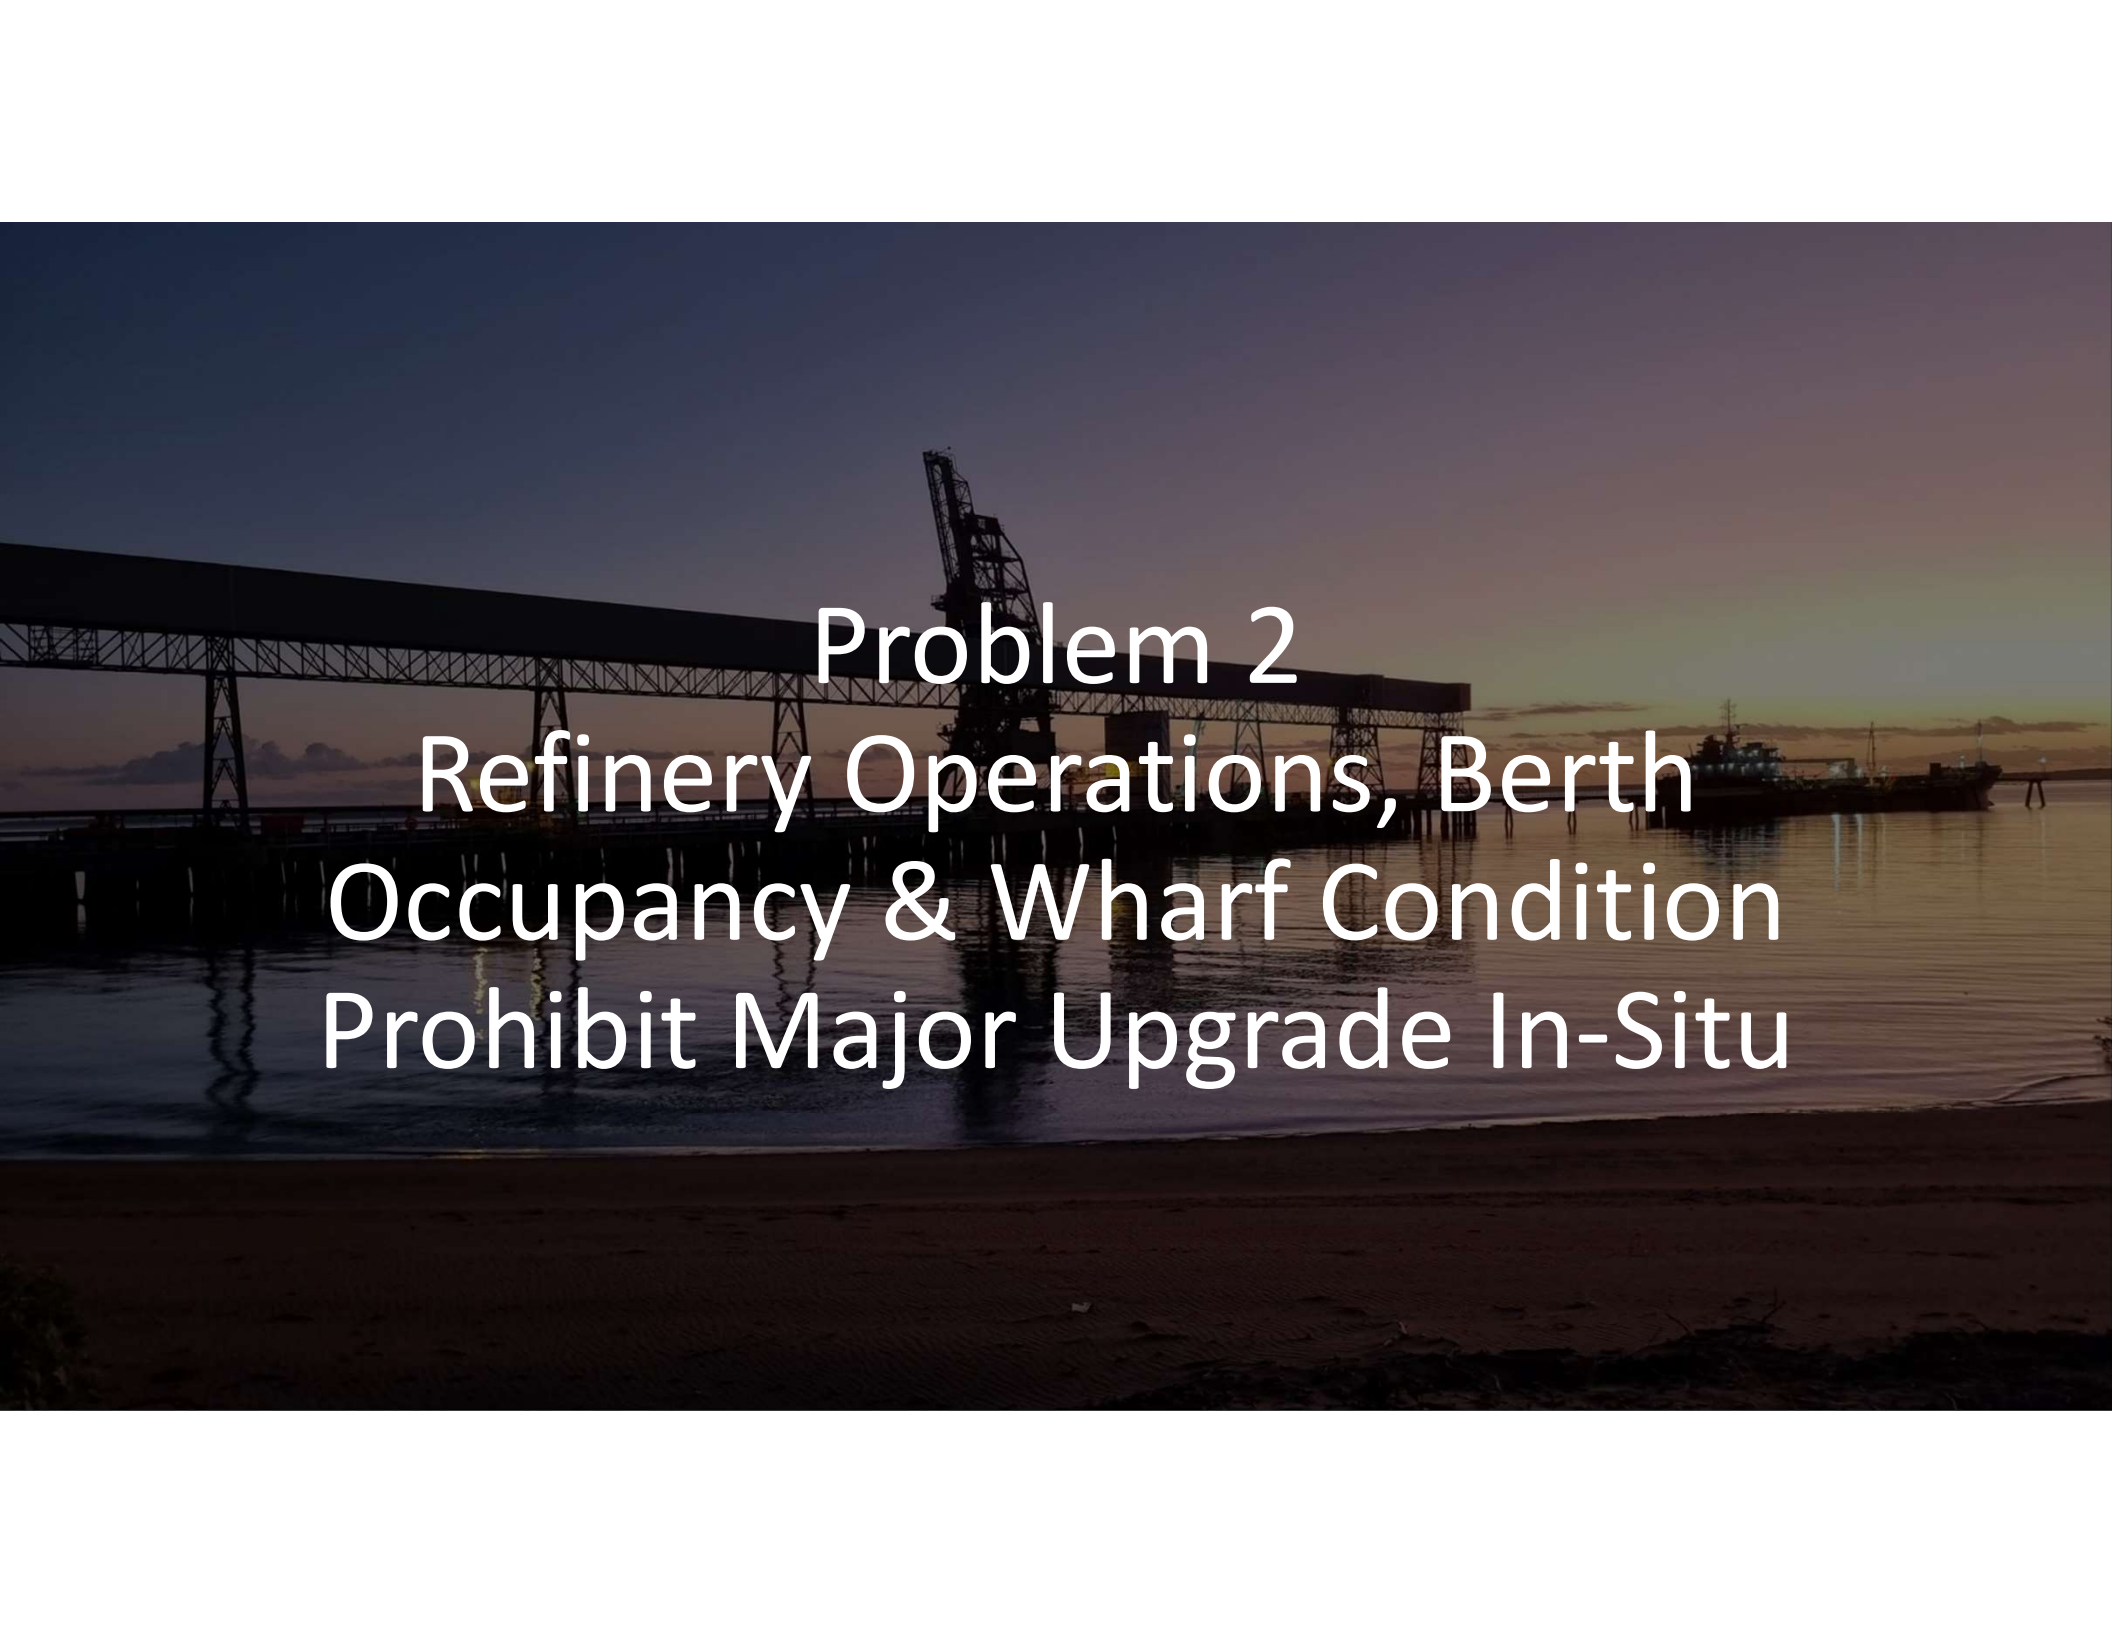

Don't go in there!

Transfer chute onto tripper gallery – poor feed control

Problem 2
Refinery Operations, Berth
Occupancy & Wharf Condition
Prohibit Major Upgrade In-Situ

Wharf Constraints

- Berth Occupancy > 70%
- Maximum wharf shutdown 15 days or refinery shuts down
- Aging wharf now in poor condition. Cannot increase wheel loads

Solution?

Proposed Solution

OEM: Reel Alesa

Fully assemble offshore
and install via HLV for
short shutdown.

Slewing "Non-breaking" joint

Dust Collection

Dust Collection

Tripper belt
cleaning –
primary +
secondary + 2 x
air knives

Airside Gravity Conveyors

Low profile "slewing" machine
results in much lower wheel loads
onto wharf minimising risk.

Upgrade
Upstream Shed
Reclaim &
Transfer Chutes

Cascade Chute

Proposed Solution

- Air Flow
- Material Flow

Slewing "Non-breaking" joint

Project Timeline

ASPEC Scope

Studies, Specification, Interfaces & Tender – 20 months

Design – 12 months
Fabrication & Assembly (UAE) – 8 months
Heavy Lift Ship to Site – 1 month
1 x 3 Day Unload Shutdown

Commissioning – 1 month
1 x 14 day shutdown

Success!

Challenges & Successes

Challenges

- **Quality Assurance.** Offshore fabrication & painting quality issues.
- **Hatch Coverage.** Difficult maneuvering past “stanchions” and hatches on “Logger” Handymax vessels due to luff restrictions.
- **Communication.** Generally good, however contract based on “standard” design and minimal handover of documentation. Design is good but lack of handover documentation made interfaces challenging.
- **Acceptance Criteria:** Quantifying “dust free” operation difficult.

Successes

- **Fast Execution.** Successfully installed and commissioned new machine on time and within tight shutdown windows. Offshore fabrication & Heavy Lift Ship strategy crucial.
- **Wharf Loading Respected.** Low profile, slewing shiploader substantially reduced condition risks, providing options for repairs.
- **No “Visible” Dust from System During Loading!** (some from ships hold ...)

THAN CODE ACCEPTABLE LIMITS

TYPICAL HANDRAIL PROFILE IN RED

Thank you.
