PIANC Asia Pacific Conference Sydney, 27-30 August 2024

Sustainability, Durability and Repair for Concrete Ports and Harbours: Insights from FIB Model Code 2020

Frank Papworth

Sustainability, Durability, Construction & Repair

- > Port sustainability in construction
- Design
 - Code Issues
 - Reliability based durability design
 - Modelling design life based on exposure and performance
 - Reduced cement, reduced section, longer life
 - Life Cycle Cost Analysis
 - Safety
- > Construction
 - Concrete as a special process
- > Repair Processes
 - Processes for effective repair specifications
 - Using risk assessment to detail repairs
 - Understanding Materials

The total asset value of ports in Australia is substantial (\$50-100 billion). They have a critical role in trade and are an integral part of the supply chain. They are vital assets to Australia's economy.

fib Model Code 2020

- > fib international structural concrete association
- ➤ MC2020 Compiled by fib's 9 Commissions
 - their task groups and working parties
 - i.e. hundreds of worldwide experts
- ➤ Goes beyond fib MC 2010, ISO codes, and Eurocodes
- > Two new features for codes
 - Based throughout on sustainability
 - Includes new and existing concrete structures

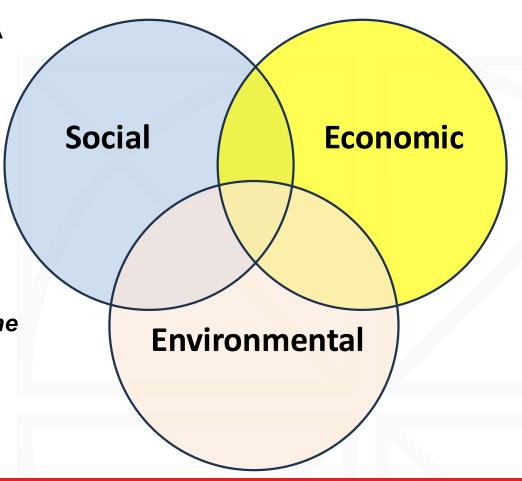

fib Model Code for Concrete Structures (2020)

©2023 fédération internationale du béton / International Federation for Structural Concrete (fi Address: Chemin du Barrage, Station 18, CH-1015 Lausanne

3 Pillars of Sustainability & Construction

➤ Design for all 3 pillars. LCCA

- Economic: \$ Cost.
 - Construction, maintenance,...
 - Operations, public
 - Disposal ...refurbishment or reuse
- Social: well-being of people
 - Safer construction and operation
 - Local environment noise, air, pollution, aesthetics, amenity
- Environment: preserve and protect the natural environment.
 - Reduced greenhouse gases
 - Better use of materials
 - Promoting circular economy

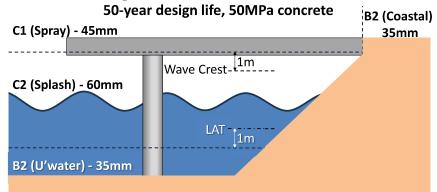

Sustainable waterborne transportation – "the long-term maintenance of environmental, economic and social well-being." Towards a Sustainable Waterborne Transportation Industry, 2011

AS Code Deemed to Satisfy Issues?

- > Issues
 - Limited options

- No reliability, or durability performance
- May not provide a durable structure
- > Stifles innovation
 - No modelling
 - No method to trade performance and cover

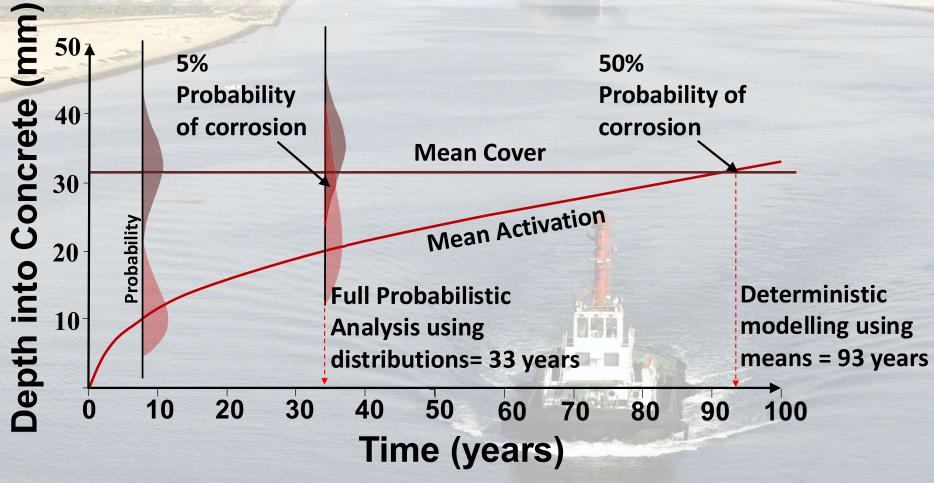

What is Reliability

- > Reliability a measure of likelihood of failure.
 - Cannot design for no failure
 - Failure (e.g. corrosion) occurs due to many mechanisms
 - e.g. Mechanism = chloride ingress rate, variables = chloride diffusivity, surface chloride level
 - Variables have a distribution.
 - Hence life modelling has to be based on probabilistic analysis (e.g. Monte Carlo).
 - Design based on calculated reliability < target reliability
- > Target reliability based on failure consequence
 - SLS (e.g. corrosion) likelihood of failure 5-10% PoF
 - ULS (e.g. collapse) very low likelihood of failure
 - Set by the parties involved
- > Reliability depends on performance

Building for climate resilience is essential to protect port infrastructure from extreme weather events and rising sea levels, ensuring uninterrupted operations in the future

Understanding Variables as Distributions

You cannot make correct decisions if you have the wrong information.

Napolean didn't attempt a Suez Canal as experts said the Red Sea was 10m higher than the Mediterranean

Design against Catastrophic Failure - ULS

In 2018 the 1967 Morandi Bridge (Genoa) collapsed due to

corrosion of a stay cable.

1.DtS requirements inadequate

2.FPA not suitable for ULS

3. Design to avoid ULS failure

4. What is and how to achieve required redundancy?

5.Care with prestressed elements

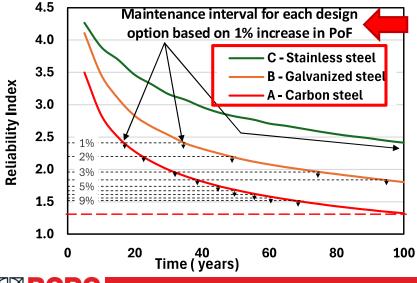

43 died. The replacement bridge has robots for cleaning and inspection.

LCCA – Major NSW Marine Structure

'Repair areas

| Case 1: Code requirement + B80 | | | | | |
|--------------------------------|------------------|---|---------------------|--|--|
| St dev = 6 mm for cover | | | FA Mix | | |

Sustainable cost solution depends on operational and public costs

Leveraging data and advanced analytics in design and maintenance planning enhances the sustainability and durability of port infrastructure, leading to smarter and more efficient operations."

Advanced Mix Design

SCC – avoids poor compaction V.Low Sorptivity – 0.036mm/m^{0.5} V.Low Chloride diffusivity 1.37x10⁻¹² m³/sec. **Very high resistivity – 45.6 k Ohm.cm**

High-performance bar spacers located to BS 7973 ensure 2mm tolerance

Well-tied reinforcement maintains 2mm tolerance

Tauranga Harbour Link

"Climate change is a major business risk. Failing to act to address the risk can be costly. Relatively few port and waterway operators have taken action." Climate Change Costs to Ports and Waterways, 2024

Construction as a Special Process

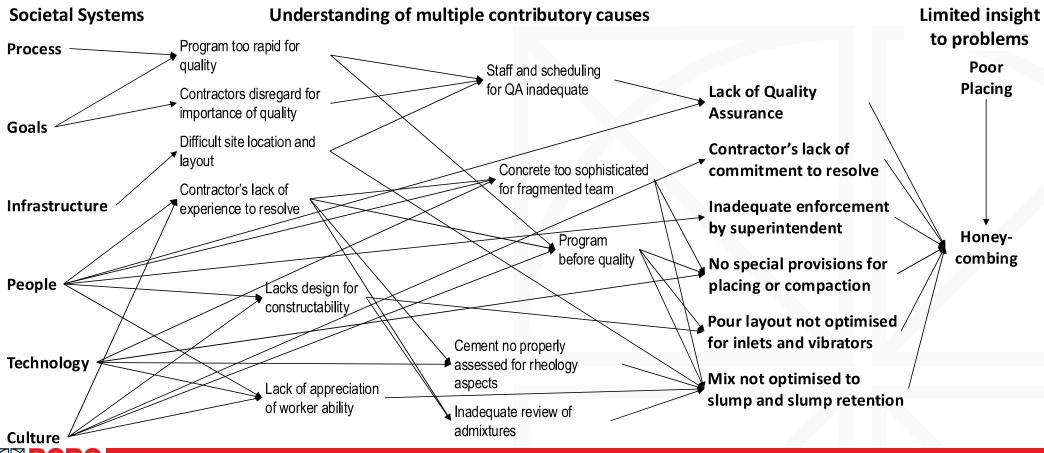

- Construct to avoid defects
- > Issues
 - Cause
 - Hidden Defects
 - Program
 - Construction Cost
 - Structural
 - Repair Durability

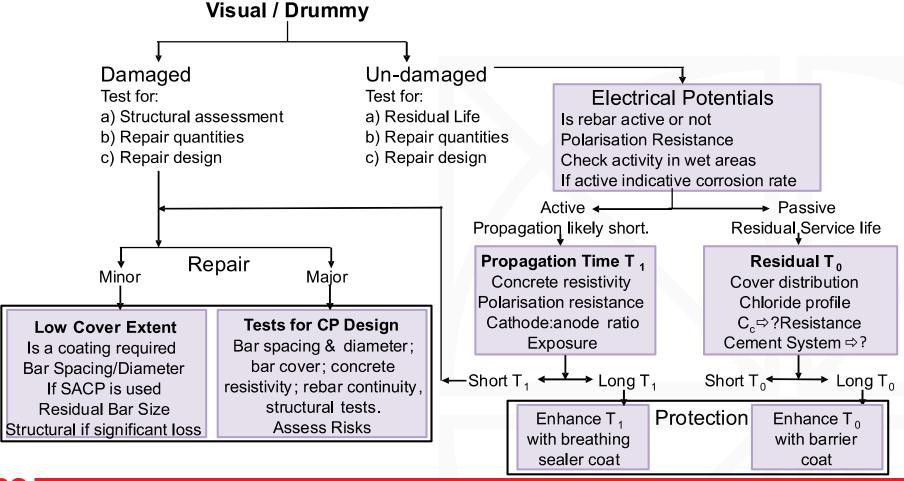

Building for climate resilience is essential to protect port infrastructure from extreme weather events and rising sea levels, ensuring uninterrupted operations in the futurec

Concrete Compaction Failure Analysis It is not Just Poor Placing!

Specifications need to recognize that concrete is a special process and need tinclude clauses that will ensure appropriate consideration is given to ensure adequate quality at each step.

Inspection and Repair Process

Survey results can be misleading if the tests and process used are not well designed and implemented. May lead to incorrect repairs and/or wrong estimate of areas for repair.

Risk Assessment Matrix

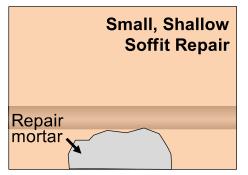

| | Consequence | | | | |
|----------------|-------------|------------|----------|-----------|----------|
| Likelihood | Negligible | Low | Moderate | Very High | Extreme |
| Almost Certain | Moderate | High | Extreme | Extreme | Extreme |
| Likely | Low | Moderate | High | Extreme | Extreme |
| Possible | Very Low | Low | Moderate | High | Extreme |
| Unlikely | Negligible | Very Low | Low | Moderate | High |
| Rare | Negligible | Negligible | Very Low | Low | Moderate |

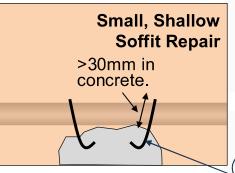

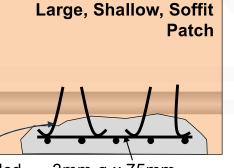

'Managing Climate Change Uncertainties' 2022 highlights why non-structural and structural interventions should be assessed. ... monitoring to inform decision-making ... methods that recognise and accommodate uncertainty.

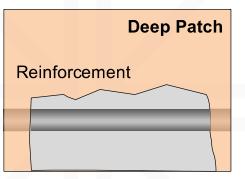

Risk Analysis - e.g. Patch Repair

| Datab Branch T | | Risk Analysis | | |
|------------------------------|-------------------------------------|-----------------|----------------|------------|
| Patch Repair Type | Performance Features | Likelihood | Consequence | Risk |
| Shallow, small, good prep. | Good bond strength. | Rare | Low | Neg. |
| Shallow, small, poor prep. | Low bond strength. | Possible | Low | Very Low |
| Shallow, large, no anchors. | Mortar's poor expansion restraint. | Walls: Possible | Walls: Mod | Moderate |
| | | Soffit: Likely | Soffit: V.High | Extreme |
| Shallow, large with anchors. | Eliminates the issue of bond. | Walls: Rare | Walls: Mod. | Very Low |
| | | Soffit: Rare | Soffit: V.High | Low |
| Moderate depth, no rebar. | Well matched/placed. | Unlikely | Low | Low |
| | Not well matched or placed. | Possible | Low | Very Low |
| Deep repairs, include rebar. | Rebar anchors & distributes strain. | Rare | Negligible | Negligible |

3mm ø stainless pins epoxy bonded in 3.5mm diameter hole.

3mm ø x 75mm stainless steel mesh

Understanding Materials Properties

- Different anodes for cathodic protection and corrosion prevention
 - Polarisation capacity
 - Anode consumption rate
 - Anode zinc mass

High polarisation of corroding bars and incipient anodes embedded in original concrete

Cathodic Protection

Only loose and damaged concrete removed

High output anodes give cathodic protection to corroding bars & incipient anodes embedded in original concrete \

Corrosion Prevention

GSC Low Output anodes give cathodic prevention to incipient anodes bars or corrosion control to corroding bars embedded in original concrete.

Loose, damaged and chloride contaminated concrete removed

of incipient anodes (uncorroded bars) embedded in original concrete

polarisation

Low

Bars cleaned to ST3

Common to CP & cathodic prevention

Saturated surface dry surface provides adequate bond & good current flow to bars Low resistivity repair mortar to give current flow to bars Zinc Rich Epoxy coating to isolate the bar from anodes to reduce anode consumption rate. Can also be applied to exposed area of bars for SACP to extend anode life

Bars cleaned to SA2.5

Conclusions

- > fib MC 2020 has detailed coverage of sustainability
 - Details life time approaches for new and existing structures
 - Code writers and specifiers should draw from MC2020
- > DtS is not the most sustainable durability design
 - Establish target reliability based on consequence of failure
 - Do FPA modelling and LCCA (3 Pillars) to select optimum design
- > Specify greater testing Know the materials
 - Performance, properties, rheology
 - Applies through design, construction, long term, repair materials
- Use risk assessment to verify repair approach

Current condition

With a better understanding of materials and appropriate models, structures could be designed for lives of 1000 yrs. Where obsolescence wouldn't make that uneconomic it would assist sustainability.

Design Life

Dam of Ma'rib

1700BC -Constructed 580m long, 4m high rock soil fill 500BC – raised to 7m high 114BC – Raised to 14m. Irrigated 100km² 570AD -Damn overtopped and left unrepaired *Service life around 2300 years.*

Great Sphinx of Gixa

2500BC - Constructed 20m x 19m x 73m cut from bedrock 1400BC – Excavated & restored with limestone block 664BC & 100AD - Cleared again

Service life around 4500 years....so far.
Low maintenance but could have been better!
