WG225 -Seismic Design Guidelines for Port Structures

Work in Progress Update

Delivering Solutions, Changing the World.SM

KBR CONFIDENTIAL

© 2022 KBR Inc.

Agenda

- Introduction
- Purpose
- Guidelines update summary

- The current PIANC 2001 Report (WG34) reflect lessons learned from the 1995 Kobe earthquake disaster (6,400 fatalities and over \$100b).
- New codes and standards, reports
 - OCDI: 2020 – Technical standards and commentaries for port and harbour facilities in Japan
 - ASCE 61-2014 Seismic Design of Piers and Wharves
 - KYDY: 2020 – Coastal Structures Earthquake Regulation (Turkey)
 - MOTEMS: 2022 – Marine Oil Terminal Engineering and Maintenance Standards
 - AS1170.4-2007 Amd 2:2018 Structural design actions

- How does this guideline contribute to the advancement of the industry and profession?
 - a practical guidance on best practice approaches
- Does the guideline implement new and innovative techniques, materials, technologies, and delivery methods?
 - combine and reflect the current best practices used worldwide
- What was the most challenging aspect of the guideline and how it is being handled to ensure success?
 - melding the various approaches used worldwide to reflect a consistent concept
- Who is the target audience for this guideline?
 - Marine infrastructure facility owners / operators, designers / practitioners, regulators, scientists / academia

TABLE OF CONTENTS

1. INTRODUCTION	5
2. EARTHQUAKES AND PORT STRUCTURES	7
2.1 Earthquake Motion	7
2.2 Liquefaction	8
2.3 Tsunamis	9
2.4 Port Structures	10
2.5 Examples of Seismic Damage	10
3. DESIGN PHILOSOPHY	15
3.1 Performance-Based Methodology	15
3.2 Reference Levels of Earthquake Motions	16
3.3 Performance Evaluation	16
4. DAMAGE CRITERIA	20
4.1 Gravity Quay Walls	20
4.2 Sheet Pile Quay Walls	21
4.3 Pile-Supported Wharves	23
4.4 Cellular Quay Walls	26
4.5 Quay Walls with Cranes	28
4.6 Breakwaters	30
5. SEISMIC ANALYSIS	33
5.1 Types of Analysis	33
5.2 Site Response/Liquefaction Analysis	34
5.3 Analysis of Port Structures	35
5.4 Input and Output of Analysis	37
REFERENCES	42

WG225 Chapters

- Chapter 1: Introduction
 - Discussion of intent and scope
- Chapter 2: Earthquakes and Port Structures
 - Discussion of earthquake hazards and how those hazards influence port structure response
- Chapter 3: Design Philosophy
 - Discussion of design criteria utilized to determine performance objectives and demand design events
- Chapter 4: Damage Criteria
 - Discussion of acceptable design criteria for different functions and type of structures
- Chapter 5: Seismic Action
 - Discussion on geotechnical inputs and seismic soil characterisation
- Chapter 6: Seismic Analysis
 - Discussion of methodologies for analysis of each structural type
- Chapter 7: Best practices in Design
 - Discussion of ductile detailing and lessons learned

Contents

1	Introduction	1
1.1	Users and Use	5
1.2	Organization.....	5
1.3	Facility Types.....	7
1.4	Structures in Scope	8
1.4.1	Earth Structures.....	8
1.4.2	Gravity Quay Wall.....	8
1.4.3	Embedded Sheet Retaining Walls.....	8
1.4.4	Cellular Quay Walls.....	8
1.4.5	Pile Supported Structures – Piers / Wharves / Jetties	9
1.5	Excluded Structures	10

Example of Significant Historic Events

Event	Magnitude (M _w)	Fatalities	Loss (\$ USD in year of event)
Los Angeles, USA, 1994	6.7	57	\$13 to \$50 Billion
Kobe Japan, 1995	6.9	6,400	\$200 Billion
Kocaeli Turkey, 1999	7.6	18,000	\$3 to \$8 Billion
Athens Greece, 1999	6	143	\$3 to \$4 Billion
Taiwan 1999	7.7	2,400	\$10 Billion
Indian Ocean, 2004 (w/ Tsunami)	9.3	228,000	\$14 Billion
Haiti 2010	7.0	300,000	\$8 Billion
Conception Chile 2010 (w/ tsunami)	8.8	525	\$15 to \$30 Billion
Tohoku Japan 2011 (w/ tsunami)	9.0	20,000	\$300 Billion
Christchurch New Zealand 2011	6.2	185	\$45 Billion
Turkiye 2023	7.8	60,000	\$165 Billion

Significant earthquakes since PIANC 2001 report

Damage sustained by a building in Concepción, located around 100 kilometres south of the epicenter.

Pile Supported Pier and Wharves – Controlled and Repairable Structural Damage San Vicente Chile 2010

Significant earthquakes since PIANC 2001 report

Gravity Bock Wall – Controlled and Repairable Arsuz Turkiye 2023

Significant earthquakes since PIANC 2001 report

Pile Supported Pier and Wharves –
Minimal Structural Damage
Severe Equipment Damage
Soma Japan 2011

Significant earthquakes since PIANC 2001 report

The coast in Wajima, Ishikawa Prefecture, was uplifted by up to 4 meters in the Jan. 1 Noto Peninsula earthquake. (Provided by Geological Survey of Japan, AIST)

WG225 – WORKING DRAFT – Chapter 1

- Stable Continent Region- Non Craton
- Stable Continent Region- Craton
- Stable Oceanic Region
- Subduction
- Active Continent Shallow Region
- Active Oceanic Region

WG225– Chapter 2:EARTHQUAKES AND PORT STRUCTURES

2016 M7.8 Earthquake, Wellington Centreport

2010 M7.0 Earthquake Port-au-Prince, Haiti

WG34-2001

3. DESIGN PHILOSOPHY	15
3.1 Performance-Based Methodology	15
3.2 Reference Levels of Earthquake Motions ...	16
3.3 Performance Evaluation	16

WG225-Working Draft

3 DESIGN PHILOSOPHY.....	32
3.1 Performance-based methodology.....	32
3.1.1 Use of this guidance document with seismic design standards	34
3.2 Performance based design approach.....	39
3.3 Performance objectives.....	40
3.4 Design Event Earthquake motions	41
3.5 Performance evaluation	42

- Design standards with performance-based seismic provisions have been published
- Performance-based design involves
 - assign a performance grade
 - obtain the associated performance objectives for various earthquake events
 - for each performance objective obtain the limiting damage criteria: typically maximum strain, stress or stability requirements for structural performance, and displacements / settlements for functional performance
- carry out analysis / design to verify structural and functional limits are not exceeded for the corresponding earthquake events

Redefining the Levels of Earthquake motions:

~~Level 1 & Level 2~~

- a) The level of earthquake motions that are likely to occur during the life-span of the structure, typically having 50% probability of exceedance during the lifetime of the structure;
- b) The level of earthquake motions associated with infrequent rare events, that typically involve very strong ground shaking, typically having a probability of exceedance between 10% and 2% during the lifetime of the structure;
- c) Possible intermediate level(s) of earthquake motions with probability of exceedance between a) and b)

Use of Guidelines:

- Always the national general standard should be complied as minimum;
 - Check if there any seismic provisions
 - If not, use this guideline in addition to the national general standard, if deemed necessary by the engineer

WG225– Chapter 4:DAMAGE CRITERIA

WG34-2001

4. DAMAGE CRITERIA	20
4.1 Gravity Quay Walls	20
4.2 Sheet Pile Quay Walls	21
4.3 Pile-Supported Wharves	23
4.4 Cellular Quay Walls	26
4.5 Quay Walls with Cranes	28
4.6 Breakwaters	30

WG225-Working Draft

4 DAMAGE CRITERIA.....	30
4.1 Gravity quay walls	30
4.2 Embedded / tied retaining walls	35
4.3 Pile-supported piers and wharves.....	43
4.4 Cellular quay walls.....	54
4.5 Relative performance of quay wall types depending on site seismicity.....	58
4.6 Damage criteria for functional requirements.....	60
4.6.1 General considerations	60
4.6.2 Quays supporting rail-mounted equipment.....	61
4.6.3 Facilities with conveyors	67
4.6.4 Facilities handling hazardous materials	67
4.6.5 Facilities whose failure would pose a threat to human life.....	70
4.6.6 Facilities with limited space in front or sensitive adjacent structures	71
4.7 Breakwaters.....	71
o Reclamation.....	72
4.7.1 Functional requirements.....	72
4.7.2 Performance limits.....	73
4.8 Dredged structures.....	75

WG225– Chapter 5:Seismic Action, Chapter 6: Seismic Analysis

WG34-2001

5. SEISMIC ANALYSIS	33
5.1 Types of Analysis	33
5.2 Site Response/Liquefaction Analysis	34
5.3 Analysis of Port Structures	35
5.4 Input and Output of Analysis	37
REFERENCES	42

WG225-Working Draft

5 Seismic Action	
5.1 Geotechnical Site Investigations (field work)	
5.2 Geotechnical Site Assessment (interpretation of investigations)....	
5.2.1 Site Response Analysis	
5.2.2 Liquefaction Potential Assessment.....	

WG225-Working Draft

6 Seismic Analysis	2
6.1 Structural Analysis Approach	2
6.2 Types of Structural Seismic Analysis.....	2
6.3 Characteristics Influencing Analysis Method Selection	3
6.4 Analysis Approaches Used in Current Codes.....	6
6.5 Peer Review.....	7
6.6 Uncertainty in Analysis.....	7
6.7 Geotechnical Improvement.....	9
6.8 Analysis of Port structures	9
6.8.1 Methods for Analysis of Retaining / Earth Structures	10
6.8.2 Kinematic Movement Assessment	16
6.8.3 Methods for Slope Systems	16
6.8.4 Analysis Methods for Open Pile / Frame Structures	21
6.8.5 Summary of Approaches for Pile Supported Structures.....	34
6.9 Analysis of Ancillary Components and Structures.....	42
6.9.1 Seismic Mass of Ancillary Components and Structures.....	42
6.9.2 Frame and Building Structure Torsion and Multimodal Response	42
6.9.3 Continuous equipment and Differential Displacements at Isolation Joints.....	42
6.9.4 Analysis / Design Interfaces / Responsibilities.....	43
6.9.5 Public or Private Personnel Occupancy	43
6.10 References.....	43

WG225–Chapter 6: Seismic Analysis

Analysis Method Selection – Types of Analyses

	Increasing Risk -->			
Risk:	Low	Moderate	High	Special
Performance Grade:	C	B	A	S
Earthquake Exposure:	Low Sa < 33%	Moderat to High		

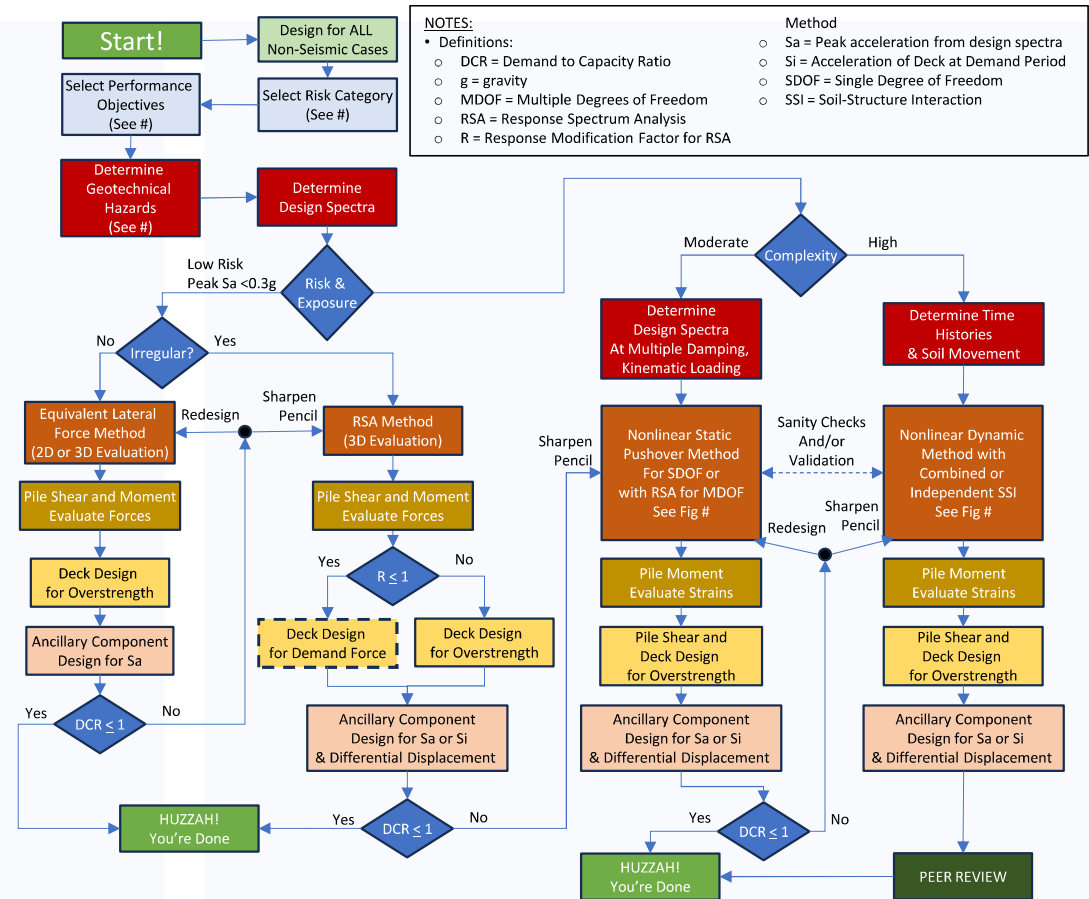

Structure Type	Analysis Method	Damage Allowance:	System Complexity	Method Use at Design Level			
				-	-	-	-
Bulkhead	Leastic Pseudo Static	No Damage	Simple	FINAL	NA	NA	NA
	Nonlinear Pseudo Static	Minor to Extensive	Moderate	FINAL	FINAL	Preliminary	Preliminary
	Newmark	Minor to Extensive	Moderate	FINAL	FINAL	FINAL	FINAL
	Nonlinear Dynamic (Time History)	Minor to Collapse	High	FINAL	FINAL	FINAL	FINAL
Pile Supported	Equivalent Lateral Force (Elastic)	No Damage	Regular SDOF	FINAL	NA	NA	NA
	Response Spectrum Anlysis (Elastic)	Minor to Extensive	Elastic MDOF	FINAL	FINAL	FINAL	Preliminary
	Nonlinear Static (Pushover)	Minor to Extensive	Plastic SDOF	FINAL	FINAL	FINAL	FINAL
	Linear Dynamic (Time History)	No Damage	Elastic MDOF	FINAL	FINAL	FINAL	FINAL
	Pushover and RSA Combination	Minor to Extensive	Plastic MDOF	FINAL	FINAL	FINAL	FINAL
	Nonlinear Dynamic (Time History)	Minor to Collapse	Plastic MDOF	FINAL	FINAL	FINAL	FINAL

Notes:
 Preliminary = analysis method appropriate for initial concept to 30% design levels
 FINAL = analysis method appropriate for final design construction documents
 NA = analysis method not applicable for stated conditions
 Sa = peak site response spectra acceleration (% gravity)
 SDOF = Single Degree of Freedom System
 MDOF = Multi Degree of Freedom System

WG225–Chapter 6: Seismic Analysis

Analysis Method Selection – Pile Supported wharves

WG225–Chapter 6: Seismic Analysis

Analysis Methods for Port Structures

Type of analysis	Simplified analysis	Simplified dynamic analysis	Dynamic analysis	
			Structural modeling	Geotechnical modeling
Gravity quay wall	Empirical/Pseudo-static methods with/without soil liquefaction	Newmark type analysis Simplified chart based on parametric studies (see Table 5.4)	FEM/FDM*	FEM /FDM*
Sheet pile quay wall			Linear or Non-linear analysis	Linear (Equivalent linear) or Non-linear analysis
Pile-supported wharf	Response spectrum method	Pushover and response spectrum methods	2D/3D**	2D/3D**
Cellular quay wall	Pseudo-static analysis	Newmark type analysis		
Crane	Response spectrum method	Pushover and response spectrum methods		
Breakwater	Pseudo-static analysis	Newmark type analysis		

WG225–Chapter 6: Seismic Analysis

Summary of Approaches for Pile supported Structures

Type of analysis	Equivalent Lateral Force (ELF)	3D Modal Response Spectrum Analysis (RSA)	2D or 3D Nonlinear Static (Pushover)	Nonlinear Time History Analysis (NLTH)
Method	Force Based	Force Based	Displacement / Strain Based	FEM/FDM time history
Design approach	Determination of forces based on simplified understanding of structural period based on structural height and material	Determination of forces based on evaluation of modal response of 3D system	Determination of displacement capacity via evaluating element strains in ductile pile section in-ground at deck. Determination of displacement demand based on effective single-degree-of-freedom stiffness response.	Determination of system <u>response based</u> time-history (force, acceleration, or displacement) individually evaluated events and incorporating hysteretic response of soils and materials. Member forces and strains evaluated based on element response during time-history.
Input parameters	2D geometry; System mass; Section properties; Material strengths; Elastic nominal capacity; Effective pile fixity (assumed w/ range); Design spectra at 5% damping (mapped); pile axial capacity in soil	Those required for ELF and: Design Response spectra(s); Response modification factor (R); Effective pile fixity (peak moment from nonlinear soil model); Cracked section stiffness; 3D geometry with representative mass locations	Those required for RSA and: Nonlinear material hinge parameters for soil and ductile structural elements; Strain limits for ductile elements; Effective pile fixity (matched moment or displacement) OR nonlinear soil springs; design response spectra(s) at varying damping levels	Those required for Pushover and: [Isolated structural model:] Time histories input at soil springs and varying by depth; soil spring accounting for gapping effects; hysteretic behavior of nonlinear hinges OR [Combined GE / SE model:] Time history at engineering bedrock, nonlinear soil properties
Output Results	Single value of lateral force for evaluation against elastic nominal capacity	Maximum / Minimum force in members, displacements at deck, accelerations at deck	Force-displacement relationship, displacement capacity (strain limited) and displacement demand, Periods, accelerations, and displacements are based on the effective damaged system.	Member forces, strains, displacements, accelerations determined from multiple time histories. Dependent on number of time histories values may be peak, averaged, or filtered to remove outliers.
